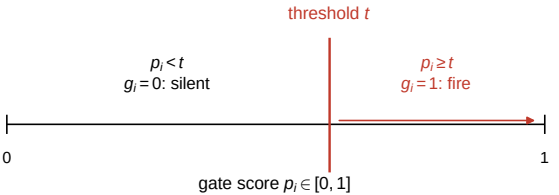
(a) The gate turns a score into a decision



t higher: fewer false alarms, more misses.
t lower: fewer misses, more false alarms.

t is chosen by trying 0.01, 0.02, …, 0.99 on validation data

(b) Four outcomes at each marker

	reference says: trigger	reference says: no trigger
gate fires	TP right call	FP false alarm
gate silent	FN miss	TN right quiet

TP + FN = 3,356 triggers
TN + FP = 24,702 silence markers

$$\text{precision} = \frac{TP}{TP+FP} \quad \text{recall} = \frac{TP}{TP+FN} \quad \text{FAR} = \frac{FP}{TN+FP}$$
